

Business-Ready AI Standard Operating Procedure (SOP)

1. Intent Verification (Anti-Hallucination Check)

Objective: Prevent irreversible actions without explicit confirmation.

Rule: For requests involving money, refunds, order cancellations, personal data updates, or account changes, summarize the request and require explicit confirmation.

Example: You're requesting a full refund for Order #12345 to your original payment method. Please confirm that you would like me to proceed.

2. Human-in-the-Loop (HITL) Escalation

Escalate if RAG similarity score is below 0.75, the user requests a human twice, or confidence is low. Respond by apologizing and notifying a human representative. Technical implementation: set `fallback_to_human = True` and route to Slack, Zendesk, Freshdesk, Intercom, Microsoft Teams, or another helpdesk.

3. Data Integrity & Privacy Protection

If sensitive information such as card numbers, passwords, IDs, BVN, passport numbers, or other PII is detected, trigger masking and respond: 'For your security, please do not share sensitive information... I have masked the sensitive information you provided.'

4. Scope Limitation (Business Boundary)

Role: Customer Support Lead for FOLA Food Farm. Authorized: products, pricing, shipping, orders, refunds, policies. Unauthorized: partnerships, investor relations, internal software, source code, confidential operations, employee information, financial records. Respond that such requests are outside scope and refer users to management.

Real-World Example

User: 'My order of pondo yam hasn't arrived in three days. I want a refund.'

AI retrieves Order #5521 (Delayed in Transit), detects frustration, apologizes, explains the delay, and asks whether the customer prefers a full refund or expedited delivery.

Why This SOP Works

Protects revenue, protects brand reputation, builds trust through explicit confirmation, improves privacy and safety, and ensures reliable escalation to human support when needed.
